CASE STUDY
FTIR for Identification of Contamination

PROBLEM
The objective of this study is to highlight the ability of FTIR to detect inconsistencies, including percent level contamination or degradation in a material.

ANALYTICAL STRATEGY
FTIR is sensitive to any component at a concentration of roughly 5% or greater, thus the technique is generally applied for identification of the polymer type but not the additives package or other minor sample components.

CONCLUSIONS
By analyzing a known polyolefin standard as a comparison, it is identified that contamination is present in the sample.

PYMS is a more powerful technique for identifying unknowns within a particular polymer family or identifying any low-concentration additives or impurities. FTIR is a great method for quick identification of the functional groups present in an unknown sample, but PYMS analysis can provide a much greater level of information and should be the method of choice when this type of information is preferred.

Company Name Confidential
Dear Valued Client,

Please find enclosed the test results for your samples described as:

1. Lot# 20110613-CTIW
2. Polyethylene Reference

The following test was performed:

1. Fourier Transform Infrared Spectroscopy (FTIR)

**Objective**

The objective of this work was to confirm that the chemistry of your sample is consistent with Polyethylene by Fourier Transform Infrared Analysis.

**Summary of Results**

The sample showed a spectrum which was most consistent with a Polyethylene blend. Spectrums of Polyethylene contain four strong bands located at 2916, 2848, 1472 and 716 cm$^{-1}$. The Lot# 20110613-CTIW sample contains these four bands and additional bands which can be seen in Table 1. The additional peaks are known to be characteristic of Polypropylene. A peak at 1718 cm$^{-1}$ is consistent with oxidation which may be occurring during processing.
Individual Test Results

A summary of the individual test results is provided below. All accompanying data, including spectra, has been included in the data section of this report.

**FTIR**

The sample spectrum was compared to our library database of ~20,000 entries and found to be most consistent with Polyethylene, however additional peaks are observed. The additional peaks are consistent with Polypropylene. Table 1 shows the spectrum peaks and their most probable identifications.

The FTIR spectrum for Lot# 20110613-CTIW is shown in Figure 1. Reference spectra for Polyethylene and Polypropylene standards are shown in Figures 2 and 3 for comparison. Figure 4 is an overlay of all three spectrums.

Analysis Conditions

FTIR

A portion was removed from your sample using a clean razor and tweezers and was tested as-is on a Perkin-Elmer PC-16 FT-IR spectrometer fitted with a DuraScope diamond ATR system (an integrated video imaging accessory). The DuraScope is designed for the analysis of all sample types. The spectrum generated by the sample was compared to ~20000 entries in our library and the best match determined based upon absorbencies and peak intensities.

Closing Comments

Deformulation of an unknown material is intended to provide a best estimate of the chemical nature of the sample. All chemical structures are supported by the evidence presented but are subject to revision upon receipt of additional evidence. Additional factors such as material processing conditions may also affect final material properties.
Jordi Labs’ reports are issued solely for the use of the clients to whom they are addressed. No quotations from reports or use of the Jordi name is permitted except as authorized in writing. The liability of Jordi Labs with respect to the services rendered shall be limited to the amount of consideration paid for such services and do not include any consequential damages.

Jordi Labs specializes in polymer testing and has 30 years experience doing complete polymer deformulations. We are one of the few labs in the country specialized in this type of testing. We will work closely with you to help explain your test results and solve your problem. We appreciate your business and are looking forward to speaking with you concerning these results.

Sincerely,

Laurie Scharp
